

Release Notes for i>clicker and i>grader version 5.5

i>clicker and i>grader 5.5 (Win/Mac) – August 2010

i>clicker

- (Mac only) Fixed the issue where instructors could not click the OK button to quit i>clicker if the i>clicker app did not have focus. Instead instructors had to use Command+Q to quit i>clicker or click the i>clicker icon in the dock to give i>clicker focus again. The i>clicker quit window now keeps focus at all times.

i>grader

- Added an option to create a report that identifies students by remote ID only. This new option will allow instructors to post student results without identifying the student.
- Added an option to export a list of unregistered clickers. This option will make it easier for instructors to show students which clickers have not been registered.
- Fixed the HTML report filenames so that the reports can be uploaded to UNIX servers.
- Fixed the WebCT Vista grade export so that an error message no longer appears when exporting. The error message occurred when students were removed from the class roster and then the results were exported for WebCT Vista. The error message DID NOT affect any of the i>grader results and could be ignored by closing the error message window.
- The Minimum Number of Required Responses field in the Set Scores window can no longer be set to "0" for a session that contains only one question.
